

Arcstream™

Metal Halide lamps

Tubular Clear – 250W and 400W

Elliptical Diffuse – 250W

Product information

High brightness, high quality white light with good colour rendition and energy efficiency makes GE Metal Halide lamps suitable for many commercial and industrial interiors, particularly in high ceiling areas.

Application areas

- Offices
- Amenity areas
- Retail warehouses
- General warehousing
- Industrial units
- Architectural floodlighting
- Area floodlighting
- Car parks

Basic data

Survival rate and lumen maintenance

The graph shows survival of representative groups of lamps operated under control conditions at 10 hours per start. Lamp life in service will be affected by a number of parameters, such as mains voltage variation, switching cycle, luminaire design and control gear. The information given is intended to be a practical guide in determining lamp replacement schedules.

Spectral power distribution

Operating note

Metal halide lamps operate with a high internal pressure and there is a slight risk that lamps may shatter, particularly if run beyond rated life. At end of life a switch off should be introduced every 24 hrs to reduce the risk of shattering. The lamp must be fully enclosed by a luminaire to ensure the retention of any fragments in the event of such failure.

Electrical data

Data is based on a nominal lamp operating from a nominal choke (reactor) ballast with power factor correction. Supply power is based on a typical commercially available ballast.

Watts	Volts ±15 [V]	Current [A]	Power [W]	Maximum Current Crest Factor
Tubular Clear				
250	112	2.75	250	1.8
400	105	4.35	400	1.8
Elliptical Diffuse				
250	100	3	250	1.8

Run-up characteristics

The graph shows typical run-up characteristics. Time for the light output to reach 90% of the final value is determined by supply voltage and ballast design.

Hot re-strike time

All ratings re-strike within 7 minutes following a short interruption in the supply. Actual re-strike time is determined by ignitor type, pulse voltage and cooling rate of the lamp.

Supply voltage

250W and 400W lamps are suitable for supplies in the range 220V to 250V and 1000W lamps for supplies in the range 380 to 415V; 50/60Hz for appropriately rated series choke (reactor) ballasts. Supplies outside this range require a transformer (conventional, high reactance or CWA) to ensure correct lamp operation. Lamps start and operate at 10% below the rated supply voltage when the correct control gear is used. However, in order to maximise lamp survival, lumen maintenance and colour uniformity the supply voltage and ballast design voltage should be within $\pm 3\%$. Supply variations of $\pm 5\%$ are permissible for short periods only. This may be achieved by measuring mean supply voltage at the installation and selecting ballasts with appropriate settings.

Effect of supply voltage variation

Control gear

There are no international standards for metal halide lamps of this type. It is therefore important to check the compatibility of lamp and control gear. Detailed information is given in this data sheet under "Guidance for luminaire manufacturers". It is essential to use a ballast appropriate to the supply voltage at the luminaire. Typical wiring diagrams for control circuits incorporating a "Superimposed" or "Impulser" ignitor and choke (reactor) ballast are shown. Refer to actual ballast and ignitor manufacturer's data for terminal identification and wiring information.

Fusing of circuits

A number of factors need to be taken into account when selecting the rating and characteristic of the supply line fuse/MCB:

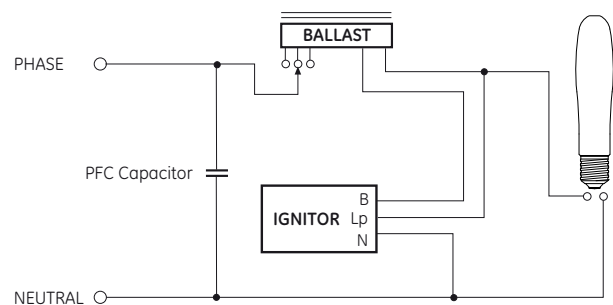

- (a) At the instant the circuit is switched-on, PFC capacitor current can be many times the steady state value for a very short period (few hundred microseconds).
- (b) For a short period (few seconds) after switch-on all discharge lamps may act as a partial rectifier and as a result the ballast can allow several times the normal supply current to flow.
- (c) During the lamp run-up period supply current is higher than normal (see graph).

Watts	1	2	3	4	5	6
Tubular Clear						
250	10	16	16	20	20	20
400	16	20	20	25	25	32
Elliptical Diffuse						
250	10	16	16	20	20	20

Typical impulser ignitor circuit

Guidance for luminaire manufacturers

Lamp operating temperature limits

Maximum Cap Temperature:	250°C
Maximum Bulb Temperature:	450°C

Control gear

To achieve correct lamp starting, performance and life it is important that lamp and control gear are compatible and suitably rated for the supply voltage at the luminaire.

Ballasts

Lamps are fully compatible with ballasts manufactured for high pressure sodium lamps to IEC60662 and for metal halide lamps to IEC61167. Enhanced performance can be achieved by using special ballasts to the specification shown below. 1000W lamps operate between phases and require special ballasts. Ballasts should comply with specifications IEC61347-1 and IEC60923. Series choke (reactor) ballasts should have characteristics close to the following values:

Supply Voltage	220V	230V	240V	250V
Tubular Clear 250W				
Impedance at 3A (W)	60	64	67.7	71.3
Based on Cold				
Watts loss (W)	24	25	26	27
Tubular Clear 400W				
Impedance at 4.6A (W)	39.6	42	44.4	46.7
Based on Cold				
Watts loss (W)	32	34	36	38
Elliptical Clear & Coated 250W				
Impedance at 3A (W)	60	64	67.7	71.3
Based on Cold				
Watts loss (W)	24	25	26	27

Ballast thermal protection

Use of ballasts incorporating thermal cut-out is not a specific requirement but is a good optional safety measure for the installation.

Ballast voltage adjustment

Series choke (reactor) ballasts incorporating additional tapings at $\pm 10V$ of the rated supply voltage are recommended. Alternatively a single additional tapping 10V above the rated supply voltage will ensure lamps are not overloaded due to excessive supply voltage.

Ignitors

Both Superimposed and Impulser type ignitors are suitable. It is recommended that only GE approved ignitors are used. Ignitors should comply with specifications IEC61347-2 and IEC60927 and have starting pulse characteristics as follows:

Watts	Min Pulse Voltage (kV) ¹	Max Pulse Voltage (kV) ²	Min Pulse Width (μ s) ³	Min Pulse Repetition Rate ⁴	Min HF Peak Current [A]
250	3.5	5	>0.3	3 / half cycle	>1
400	3.5	5	>0.3	3 / half cycle	>1
1000	2	5	>0.3	1 / half cycle	>1

1. When loaded with 100 pF.

2. When loaded with 20pF.

3. At 90% peak voltage.

4. From ignitor into lamp during starting.

Timed ignitors

Use of a "timed" or "cut-out" ignitor is not a specific requirement, but it is a good optional safety feature for the installation. The timed period must be adequate to allow lamps to cool and restart when the supply is interrupted briefly (see "hot re-strike time"). A period of 5 minutes continuous or intermittent operation is recommended before the ignitor is automatically switched off. Commercially available 10/11 minute timed ignitors are suitable.

Cable between ignitor and lamp

Cable connected between the lamp and a superimposed ignitor “Lp” terminal, or the ballast when using an impulser ignitor, must be rated at a minimum 50/60Hz voltage of 1000V. Mineral insulated cable is not suitable for connecting the lamp to the control gear. To achieve good starting superimposed ignitors must be adjacent to the luminaire. Cable capacitance of wiring between the ignitor “Lp” terminal and the lamp should not exceed 100pF (<1 metre length) when measured to adjacent earthed metal and/or other cables, unless otherwise stated by ignitor manufacturer. When using impulser type ignitors longer cable lengths between ballast and lamp are normally permissible. Limits for particular ignitors are available on request from GE Lighting or directly from the ignitor manufacturer.

PFC capacitors for simple choke circuits

Power Factor Correction is advisable in order to minimise supply current and electricity costs. For 220-250V supplies 250V±10% rated capacitors are recommended as follows:

	250W	400W
Tubular Clear		
PFC Capacitor	30µF	40µF
Elliptical Diffuse		
PFC Capacitor	30µF	-
