

Dimmable T-12 Tubeguard

Glare and harsh light can now be regulated with our Adjustable Light Control line of tubeguards. Available in several different configurations, the most common is the 4' - T12 size. This product utilizes a pattern of black dots that are evenly positioned running the length of the tube. As the tubeguard is rotated, the dotted pattern progressively gets closer together producing a solid black line. This rotation affects the light projection and allows the user to position the tubeguard to control exactly the light output and direction desired. Glare on the computer screen, harsh light reflecting off paperwork and other lighting related discomforts are now resolved.
