IMPORTANT .... Read this User Manual Before Installing...!!!

# Introduction and Intellectual property Rights Statement

Thank you for using the EE815WDC LED Smart Light. With its effortless setup and lightweight design, the EE815WDC LED Smart Light conforms to all your lighting needs. It was designed and built to provide many years of trouble free service using environmentally friendly Solar-Hybrid-Lithium based energy technology. This product is covered under multiple US, European, China and other International patents granted and pending worldwide. *All rights reserved*.

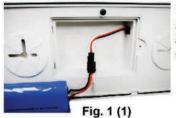

# Initial Installation (Refer to Fig. 1)

## Connecting the Battery before setting up

- 1. The battery has been pre-charged before shipping and the light is ready for use
- 2. Make sure the main switch is in the OFF position
- 3. Open the battery compartment cover on the back of the light and plug the battery into the connector and carefully make sure the plug position is correct then replace the cover (Fig. 1-1)
- Initially check the LED illuminator and battery by slowly moving the main switch to position A or B, it should light up, then turn the switch back to OFF for installation

### Mounting the Light Fixture

- 1. Choose a flat and stable mounting surface with maximum exposure to sunlight. Cut the mounting template from the back of the package and use it to mark the two screw mounting holes. The screw mounting holes also have reference "Marks" on the light body. refer. Fig. 1(2)
- 2. For wood mounting surfaces: Drill the screws into the pre-marked locations and mount the unit on wall. For concrete/brick/stucco: Pre-drill clearance holes using a 3/16" masonry bit. Insert the plastic anchors and screws. Then mount the unit on wall. This light can be mounted horizontally in a high position to project light toward the ground or it can be mounted vertically to project light sideways onto walls, or gated areas.
- 3. This light fixture with integrated solar panel must be mounted in a non-obstructed position where it will receive an average of at least 4 hours daily of direct sunlight all year round. It requires a sturdy mounting location such as a building/house, fence, wall, patio, roof, under the eaves, or secure pole e.g. Securely mounting this unit and self contained solar panel ensures that it will perform well in all weather conditions.
- 4. For Northern hemisphere installations this light fixture should be mounted with a Southerly facing position and visa-versa for Southern hemisphere installation it should face to the North (Australia, South Africa, South America e. g.)
- 5. A small RED-LED indicator (under motion detector lens) will begin making a double flash indicating that charging status is active during a normal sunny, partially sunny or cloudy day (If this does not make an indication that means the battery's status is fully charged).
- 6. Open the left side cover (refer. Fig. 2) move the function switch to B position (recommended) to start the Initial Set-up or Walk test procedure. Please refer to the <u>3 Mode-Selectable One step Set-up</u> instructions and also refer to Page 2 for procedure details. Must remove the protective film on top of the solar panel before using.
- 7. After the Initial Set-up test, if there is no motion during the testing delay time period (10 min.), the unit will enter into normal operation and illuminate automatically only when the environment becomes dark.

Connect Li-Battery before operation

Mount on the Two Screws

Fig. 1 Installation Steps

## 3 Mode-Selectable One step Set-up (Refer Fig-2 and PG 2 for more info)

1. SMART B Profile/Mode (Max-bright adjustable)- <u>This mode is recommended and can be used for most illumination/lighting applications:</u>

**Set the Main Switch** to **B** (downward position). Set the **Left Dial** between **L--H** for the desired Max-brightness level above soft-glow illumination once activated by motion, (M--H is recommended). Set the **Right Dial** between **L** to **H** (M to below H is recommended)

2. SMART A Profile/Mode (Soft-Glow Dimming brightness adjustable):

**Set the Main Switch** to **A** in the center position. Set the **Left Dial** between **L--H** for the desired level of soft-glow illumination when motion is not detected, (L--M is recommended). Set the **Right Dial** between **L to H** (M to below H is recommended)

3. SMART AUTO Profile/Mode (Motion activated lighting only):
Set the Main Switch to either A or B. Set the Left Dial to AUTO in the far left position.
Set the Right Dial between L to H (M to below H is recommended)

Daylight White Illumination

(BP

Fig. 2 Functions

Rev. EE815WDC.062015 Page 1

# **SMART AUTO Profile**

In either *A* or *B* position, if the Left Dial is set to *Auto* (turned all the way to the far left past "L" to the "Auto" position) then this light will convert to operate as a traditional motion sensing light. In this *SMART AUTO mode* it will light up to full brightness when motion is detected. When the Left Dial is set at the *AUTO* position the illumination time has a fixed 60 second delay time for the light to be **ON** after motion is detected and the lighting will be extended as long as motion is continually detected. It will not turn off until the motion detection has stopped and after the illuminating *Delay Time* has expired. The motion Sensitivity/Range can be adjusted using the *Right Dial* (Ref. Fig. 2, page 1), to set the desired Sensitivity/Range for the application. This adjustment has a motion sensing range from Low 5', Med. 15', High 40' (For most applications set the dial to between M--H, in warmer temperature environmental locations set this slightly higher.)

# User Tips (video reference: www.eesgi.com)

- 1. To set up your new *eLEDing* light for your applications the unit comes with an initial *Set-up/Walk* Test mode to ensure proper installation and performance is optimized. To activate this mode move the main switch from *OFF* to *B position as SMART B profile*. This test mode can be reactivated at anytime (night or day) to adjust your settings for your application by sliding the switch to *OFF then to B position and then making your dial settings*.
- 2. When the main switch is set initially to **SMART B profile from the OFF** position the Set-up/Test mode will be active for a period of 10 minutes allowing the user to adjust the light settings. This mode will work in day or night time conditions. The Motion Sensitivity/Range (right dial) can be adjusted at this time for your application from 5' minimum to 45' maximum.
- 3. The **Set-up/Walk** Test mode is active as long as motion is detected and it will automatically disable itself if 10 minutes has passed without motion being detected. During this test period the small Red LED indicator will flash providing visual motion sensing reference as a confirmation of motion detection adjustments. When a period of 10 minutes passes without motion detection the unit will automatically switch to normal operation mode. It will stop illumination if the set up test was made during daylight conditions and it will start illumination again once it senses a change to darkness from daylight ambient light conditions.
- 4. After the initial Set-up/Walk Test is complete the main switch may either be kept in the SMART B profile or set to the SMART A profile. For most applications SMART B position is recommended. In both A and B profile if the Intelligent Power Management (IPM) system detects that the battery does not have enough capacity to operate these modes in critical weather conditions then it will convert to AUTO mode. And if it detects that there is insufficient battery reserve to operate in Auto mode then it will automatically disable illuminating functions leaving only the charger active to protect the battery from being damaged. After enough sunlight is received to charge the battery, the unit will first return to AUTO mode for motion activated lighting until it receives enough sunlight energy to operate the SMART profiles properly.
- 5. **Note:** The *Red LED indicator* light flashes for the following reasons: 1) To indicate motion activity during the 10 minutes initial Set up/Walk Test. 2) To indicate the battery is low when the sensor detects motion during darkness. 3) To indicate charging status during normal charging daylight conditions, or when the AC/DC-digital charger (optional) is being used for charging in any conditions.
- 6. Storage: If this unit has been stored over six months before initial operation then the battery may need to be re-charged. To re-charge the battery after storage turn the main switch to OFF, connect the battery, plug the wire cord from the solar panel into the light and place it in direct sunlight for 1-2 days. Or charge for 2-3 hours using only our optional accessory AC-DC Digital/Switched Power Adapter (EE-DPS-0.8A). The Li-Battery will charge in any of the three switch position including OFF.
- 7. Spot Light/Projection Lighting as Traditional full bright ON without motion: This option converts the light to provide continuous adjustable up to full brightness level illumination for up to 8HRS or more. It can be used as a wall washing light to project lighting on signs, flags, and areas that need spot lighting. Set the main switch to position A. Then make sure to adjust the Left Dial from M or all the way to the max (H) position as desired, and adjust the Right Dial (Sensitivity) to the lower (L) position (refer Fig 2).
- 8. An optional AC-DC digital power adapter (EE-DPS-0.8A Fig. 5) can be used as a quick charger. Also with this adapter it can be used in all profiles and modes as a standard AC/DC powered motion sensing flood light with battery back-up capability for indoor/outdoor security/safety lighting applications. It can be wall or table mounted, or used as a standard portable/table light (Fig. 5). Using this option it can be used in any of the three profiles.
- 9. Important Note: Lowering the Left Dial setting in either A or B profile will extend the battery capacity reserve and provide extended illuminating ability in geographic locations with poor sunlight, such as North West and North East of American e.g.

### Specifications

Light fixture: Black Color (BP) or White Color (WP), PC plastic	Detecting Range(adj.): 160°, up to 45'x 45' (L-5'/1.5m to H-30'/9m)
Light Head: 4W CREE LED up to 160° W x 140° V (5000K Color)	Green Energy Storage: 16WH Li-Poly (Lithium based battery)
Solar Panel: 12VDC/3.0W Monocrystalline	Smart Modes: Mode B up to 40+ hrs; Mode A 9-40+hrs w/IPM*
Brightness: Up to 800+ Lumens (=60+W Holagen lamp) on peak	Operation Temp: -4°F to 125°F; Consumer Standard Weatherproof (IP54)
Weight: 1.6LBs / Demension: L 13 3/8" x W 4 1/2" x H 3 /3/8"	Complies with: FCC Part 15 Class B and ICES-003:2004. CE

\*Continuous dimming illumination/Dusk to Dawn capability claims under fully charged battery and no motion triggered condition.

## One Year Limited Warranty

EESGI guarantees this product to be free from defects in material & workmanship for (1) year.

This warranty does not apply to damage from misuse or incorrect installation/ connection.

This warranty does not cover accessories, bulbs, batteries, accidents, alterations, unauthorized use or repair, neglect, misuse, abuse, damages or defects resulting from normal wear and tear (including chips, fading scratches, abrasions or discoloration due to usage or sun exposure), or failure to follow instructions for care and maintenance, fire, flood, and Acts of God.

This warranty does not include liability for incidental or consequential damages.

**EESGI** is not responsible for any damages in excess of the retail purchase price of the product under any circumstances. The consumer is responsible for the installation of, removal of, and reinstallation of the product.

Customer service: (877)579-3889, www.eesgi.com
